

Disclose of AI assistance

I used AI during the development of this project mainly to learn and solve a few problems I came across.

- I used AI to understand how to run the Maven tests using mvnw.cmd clean test.
- I asked AI which data type would be better for storing transaction amounts. It explained that using float or double can cause precision errors when dealing with monetary values. It suggested using BigDecimal, so I used BigDecimal for the transaction amount.
- I used AI to learn how to write JUnit test cases and understand assertions.
- Initially, I did not use try-catch blocks. Later, I asked about better ways to handle errors and added exception handling to the service layer.
- I also used AI to understand and fix some errors while developing the APIs.

I used AI for guidance and learning, while implementing and reviewing the changes myself.
